

# TDMS

## A new standard of simplicity in test data management

The more extensive an IT infrastructure is, the more effort is required for corresponding system testing, quality assurance and training. Companies often face serious logistical, technical and organisational challenges in this regard, especially when each of their production systems is associated with multiple non-production installations.

With SAP Test Data Migration Server, you'll have the support you need in this area. TDMS makes it possible to assemble streamlined and consistent development, testing, QA and training systems and automatically supply them with the latest test data available. It even includes time-dependent and process-specific functions.

### IT COULD HARDLY BE EASIER

SAP TDMS is the ideal tool for keeping infrastructure and maintenance costs under control in quickly growing SAP landscapes.

- With it, clean and consistent business processes are available for testing at all times within the target system in question.
- Smooth compilation of various test scenarios for parallel IT projects across multiple organisational units and time frames
- Drastic reduction in the effort required for follow-up processing of administrative data objects in the target system (interfaces, users, authorizations, etc.)
- Option to refresh specific individual clients and company codes in target systems involving multiple clients
- Anonymisation of sensitive data according to your particular needs

### HOW YOU'LL BENEFIT

- Predefined selection scenarios for business objects
- End-to-end business processes/comprehensive test cases for master data: SAP module level [sales or materials, for example]  
Processes: SAP process level [purchasing based on orders, sales orders, etc.]
- Transaction data: SAP process level [purchasing or customer billing documents, for example]
- Covers key areas of ERP and industry solutions
- Data extraction based on built-in dependencies
